                                                                                                                                                                                                                                                                                                                                                                 Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the human adenosine Al receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothioate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they protein coupled family of cell surface receptors is a member of the Grenostein coupled family of cell surface receptors that have 7-transmembrane segments. These oligonucleotides can be used to treat or prevent conditions associated with bronchoconstriction and/or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   inflammation in humans or other animals e.g. asthma, pulmonary disease,
                                                                                                                                                                                                                                                                                  Treating respiratory disease with antisense sequences directed agains adenosine or bradykinin receptors - with localised delivery to the respiratory system, suitable for long term treatment of asthma, adult respiratory distress syndrome etc.

Sequences AAV46501-V47446 are anti-sense oligonuclectides that target the human adenosine A1 receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary carructure of this targets mRNA. The adenosine receptor mRNA secondary carructure was both analysed and used to construct antisense coligonuclectides containing a phosphorothioate backbone. Once the attisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonuclectides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-cortaining either a junction between the intron and exon, or where they protein coupled family of cell surface receptors that have 7-cortaining either a junction between the completions associated with bronchoconstriction and/or lung inflammation in humans or other animals e.g. asthma, pulmonary disease,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                         PCR primers AAV35877-996 were used in a rapid amplification of polymorphic DNA (RAPD) reaction in the assay of the invention. This assay is used to determine if an animal has an allele for, or muscle fibre composition (MFC) characteristic of, the Duroc pig. Duroc pigs produce meat of superior quality (particularly tenderness) but are normally less efficient feed converters and fatter than other types. The assay comprises analysing a tissue sample to determine if the genotype comprises the allele, and genetic features typical of animals with Duroctype MFC are present. The method is used to select animals with have Duroc characteristics for use in breeding programmes (to develop the animals with Duroc pig characteristics), and to assess meat quality
                                                                                                                                                                          Assay for alleles or muscle fibre composition characteristic of Duroc type pigs - comprises determination of genotype or muscle fibre properties, used to identify animals for breeding programs and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense oligonucleotide; multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmonary vasconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary bypertension; pulmonary vasconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
con-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons of mixtures. The antisense oligonucleotides may be derived
from sequences AAX55272-74. These multiple target oligonucleotides
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX55272-74. These multiple target oligonucleotides
conditions or mixtures. The antisense oligonucleotides
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
cutte asthma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
cutte asterma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
colon cancer, breast cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancers which may metastasize or have metastasized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense oligonucleotide; multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmonary vasconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
con-coding regions of RNAs corresponding to target genes, gene initiation
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons of the juxta-section between coding and non-coding regions and all
codons of mixtures. The antisense oligonucleotides may be derived
from sequences AAX55272-74. These multiple target oligonucleotides
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX55272-74. These multiple target oligonucleotides
conditions or mixtures. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
cutte asthma, allergies, asthma, impeded respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
cutte asterma allergies as the fibrosis, pulmonary programmary
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, coding and con-coding regions of RNAs corresponding to target genes, coding and con-coding regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense chigonuclectides may be derived from sequences AAX5512-4. These multiple target oligonuclectides from sequences AAX55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, allergic rhinitis, catte asthma, allergise, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, collesses (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, parencer, parencer, parencer, parencer, minged cancer; parencer, parenc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                             The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
con-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
cend and the juxta-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX5512-74. These multiple target oligonucleotides
conditions or mixtures. The antisense oligonucleotides are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
caute asthma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
culmonary vasoconstriction, emphysema, chronic obstructive pulmonary
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, pancreatic cancer,
chaptecellular carcinoma, kidney cancer, melanoma, hepatic metastasized
well as all types of cancers which may metastasize or have metastasized

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
end and the juxta-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX5512-74. These multiple target oligonucleotides
conditions or mixtures multiple target oligonucleotides
from sequences AAX55180-271) can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, allergic rhinitis,
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
acute asthma, allergies, asthma, impeded respiration, respiratory
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, pancreatic cancer,
colon cancer, breast cancer, lung cancer, pancreatic cancer,
colon cancer, breast cancer, lung cancer, pancreatic cancer,
colon cancer, breast cancer, lung cancer, melanoma, hepatic metastassized
cothe lungs, including breast and prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                 analysis of fungal isolates of Dydimella bryiniae and Phoma species. The new method may be used to distinguish D. bryoniae from non-pathogenic Phoma species fungal infections in Cucurbts (i.e.cucumbers, pumpkins, watermelons, gourds, cantaloupes, squashes and related plants). The new method of detection of D. bryoniae and Phoma species infections allows method which involved growing pure cultures of the pathogens from the infected plants and identifying them under the light microscope. The method leads to the early treatment of the infected plants with fungicides resulting in an increased chance of saving the infected food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysem; pulmonary hypertension; chronic obstructive pulmonary disease; COPD;
                                                                                                                                                                                       Detecting a pathogenic fungus in cucumbers, pumpkins and gourds using recombinant techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets concless involved in bronchoconstriction, allergies, and/or inclaimmation. The ON can have antinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating c. impaired airways, including lung diseases and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating c. impeded respiratory distress syndrome, pain, cystic impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive cractionary disease (CODD), and cancers such as leukamias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the conchoconstriction and inflammation. AAA33313 to AAA33312 represent the crelease of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA33313 to AAA33312 represent the cinvention which correspond to SEQ ID NO:1 to 1815, but the sequences differ correspond to SEQ ID NO:1 to 185, but the sequence correspond to SEQ ID NO:1 to 185, but the present invention. N.B. Sequences given in the disclosure of the present invention. N.B. Sequences given in the disclosure of the present invention. N.B. is an in the sequence given in the sequence given in the sequence given in the sequence invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating c. impaired airways, including lung diseases syndrome, pain, cysic impaired respiration, respiratory distress syndrome, pain, cysic fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including brease (ODD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including brease and prostate cancer. The reduction of the adenosine content of the carcinomas, and effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing conchoconstriction and inflammation. AAA3313 to AAA35312 represent to invention, which correspond to SEQ ID NO:1 to 185, but the sequences differ cinvention, which correspond to SEQ ID NO:1 to 185, but the sequences of from the previously named sequences. SEQ ID NO:1 to 185, but the sequence of from the disclosure of the present invention. N B. Sequences given in the disclosure of the present invention. N B. including the present invention of the present invention. We have the present invention of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present interitors a new composition composition controlled to the present interitors and analyses and controlled to the present interitors are interested and controlled to the control of diseases associated with inflammation.

Controlled airway, including lung diseases and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating of e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the release of deoxyadenosine which activates adenosine receptors causing carcinomas, and cancers which activates adenosine receptors causing chronic obstruction and inflammation. Assalsia to Assalsia represent the nucleotide sequences given in the sequence listing from the present cinvention, which correspond to SEQ ID No:1 to 185, but the sequences differ invention, which correspond to SEQ ID No:1 to 185, but the sequence of from the present invention. N.B. Sequences given in the disclosure of the present invention. N.B. corresponding SEQ ID NO: sequences given in the sequence given in the sequence in the present invention. N.B.
                                                                                                                                                                                                                                                                                                                                                                                                                                     present invention describes a new composition comprising an antisense nonucleotide (ON) with low adenosine (up to 15%), which targets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; adenosine receptor; low adenosine antisense oligonucleotide; phosphorothioate; impaired respiration; inflammation; allergy; allergic disease; bronchoconstriction; inhibitor; antiinflammatory; antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway;

The present inventor describes a new composition composition of integral and integral described (MI) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or confident in the ON can have antiinflammatory, antialergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation.

Compaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating c.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive cuplunoary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the CONs reduces side effects. The A-containing ONs break down with the convention which correspond to SQI DN NO:1 to 2815, and then the last 185 concernation, which correspond to SQI DN NO:1 to 185, but the sequences differ invention, which correspond to SQI DN NO:1 to 185, but the sequence is sequences are also called SRO ID NO:1 to 185, but the sequence from the previously named sequences. SQI DN NO:1 to 185, and then the last 185 concernation of the present invention do not match the invention of the invention of the present invention of the sequence jiven in the disclosure of the present invention do not match interior.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present invention describes a new composition comprising an antisense
lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD; cancer; leukaemia; lymphoma; carcinoma; metastasis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

c ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emplyseme, chronic obstructive cultimonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including to breast and prostate cancer. The reduction of the adenosine content of the ONS reduces side effects. The A-containing ONS break down with the calcase of deoxyadenosine which activates adenosine receptors causing to ronchoconstriction and inflammation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to ENG ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to AAA33922) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention do not match is the corresponding SEQ ID NO: sequences given in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiathmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating
                                                                                                             antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD; cancer; leukaemis; lymphoma; carcinoma; metastasis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The sequence becomes incorporated into the PCR product and, when digested, the sequence will create sticky ends to facilitate cloning of the amplifited fragment. hTTF may be used for the treatment of peptic ulcers and inflammatory bowel disease, and for protection of the intestinal tract from injury caused by bacterial infection or radiation detection of ITF may also be used to produce monoclonal antibodies for the detection of ITF in an intestinal tissue or blood serum by indirect immunoassay. ITF can also be used to treat neoplastic cancer

activation of the cycotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cycloxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cycloxic T-lymphocytes (CTis). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequences AAZ77573-Z79709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory coffector proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTs (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cells other transcripts correspond to novel genes. Antigen-presenting cells (APC) associated costimulatory factors play an important role in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.

for agents that modulate expression of differentially expressed genes in an APC; and as hybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used to identify call be used in active immunotherapy (or to stimulate production of appulation of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen and APC-associated costimulatory factors ensures adequate antigen and account of the ac
                                                                                                                                                                      presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; monocyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss.

Sequences AAZ7573-Z79709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding carpression) tags used to identify mRNA transcripts encoding differentially expressed in monocyte-derived dendritic cells compared differentially expressed in monocyte-derived dendritic cells compared (expressed sequence tags) which were previoually unknown to be compared to preferentially or differentially expressed in dendritic cells, while compered sequence tags) which were previoually unknown to be compared or complex) and information of the cytocoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone in the complex) and subsequent recognition by T-cell receptors is alone complex) and subsequent recognition by T-cell receptors is alone complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytoxic immune response that can lyse complex) and subsequent recognition by T-cell receptors is alone complex) and subsequent recognition by T-cell receptors is alone complex, and subsequent recognition of cytocoxic immune response that can lyse complex and subsequent recognition of cytocoxic rumune response, particularly sequences identified using the SAGE tags have several potential uses.

They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate expression of differentially expressed genes in confidence and subsequent monitoring of diseases related to abnormal companies, promoses and expressed genes, promoses and employed in the dendritic cells ontaining these genes containing the sequence of them are used in active immunotherapy (or to stimulate production of antigen specific effector cells ontaining these genes containing the production of constituitatory signals, migration of constituitatory signals, migration of constituitatory signals, migration of constituitatory si
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

calls, useful in gene vaccines against cancer.

Claim 1; Page 90; 130pp; English.

Claim 1; Page 90; 130pp; English.

Sequences AAZ77573-Z79709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while preferentially or differentially expressed in dendritic cells, while preferentially or differentially expressed in dendritic cells, while cother transcripts correspond to novel genes. Antigen-presenting cell (APC)-associated costimulatory factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells. Immunostimulatory cofactors also being required for insufficient to activate a robust cytotoxic immune response that can lyse insufficient to activate a robust cytotoxic immune response that can lyse clinelicient activation of cytotoxic impunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses.

They may be used in vaccines to induce an immune response, particularly

dgainst a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in APC; and as hybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a countient of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen and APC-associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells ö SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; monocyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss. Sequences AAZ77573-279709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding timmunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared (expressed sequence tags) which were previously unknown to be correspond to novel genes. Antigen-presenting cells, while preferentially or differentially expressed in dendritic cells, while cother transcripts correspond to novel genes. Antigen-presenting cells other transcripts correspond to novel genes. Antigen-presenting cells certivation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors at alone insufficient to activate a robust cytotoxic immune response that can lyse complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse complex) and subsequent recognition by T-cell sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against that modulate expression of differentially expressed genes in containing these genes contained to these genes, prognosis and monitoring of diseases related to abnormal expressed genes, or of their encoded proteins, can be used in active immunothesized colls ontaining these genes containing them are used in active immunothesized production of the dendritic cells ontaining them production of antigen-specific effector cells) and vectors containing proper presentation of antigen-specific effector cells and vectors containing presentation of co-stimulatory factors ensures adequate antigen presentation of cells contained by migration of cells on the monocyte lineage. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agants that modulate expression of differentially expressed genes in an APC; and as hybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially captesion of these genes petection of the dendritic cell differentially cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a popularion of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen presentation of co-stimulatory signals, migration to Tcell-rich sites, recruitment of immune effector cells

```
Expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (appressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while correspond to novel genes. Autigen-presenting cell chert transcripts correspond to novel genes. Autigen-presenting cell chert transcripts correspond to novel genes. Autigen-presenting cell activation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in an APC; and as hybridisation probes/amplification primers for the appression of these genes. Detection of the dendritic call differentially expressed genes can be used in active immunotherapy (or to stimulate production of a population of antigen specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen presentation of co-stimulatory signals, migration of co-stimulatory s
                                                                                                                                                                                                                                                                                                                                 Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    that are preferentially transcribed in the metaatatic breast tumour transcripts that are preferentially transcribed in the metaatatic breast tumour cells). AAZ83942 tissue (i.e. are upregulated in metaatatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cirsue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of c.g. therapeutic genes (also ribozymes or antisense sequences). Darticularly an antigen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising specific continuals and isolate populations of educated, antisense sequences or antisolates (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antisen-specific immune effecter immune because of immune of immune because of immune of immune of immune of immune of immune of

that are preferentially transcribed in the metastatic breast tumour tribused to that are preferentially transcribed in the metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcribes that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcribes can be used for diagnosis, prognosis, monitoring and transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for diagnosis, prognosis, monitoring and transcribts are metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions.

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcribts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), extincinally an antigen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising specific vaccines, for diagnosing breast cancer and for raising specific cantibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter immune east.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

that are preferentially transcribed in the metastatic breast tumour cells). AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cils). These tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antiense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

Claim 1; Page 92; 219pp; English.

treatment of cancer.

```
tissue (i.e. are upregent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upreglated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (bb). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences).

CC e.g. therapeutic genes (also ribozymes or antisense sequences).

CC e.g. therapeutic genes (also ribozymes or antisense sequences).

CC e.g. therapeutic genes (also ribozymes or antisense sequences).

CC e.g. therapeutic genes (also ribozymes or antisense sequences).

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts
that are preferentially transcribed in the metastatic breast tumour
tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942
to AAZ86677 represent tags corresponding to distinct transcripts that are
preferentially transcribed in the primary or non-metastatic breast tumour
tissue (i.e. are downrequlated in metastatic breast tumour cells). These
transcripts can be used for diagnosis, monitoring and
treatment of breast cancer, particularly where metastatic. Diagnosis is
by standard immunoassays or hybridisation/amplification reactions.

Compounds that modulate expression of the transcripts are potentially
useful for treatment of (metastatic) breast cancer, while promoters from
the transcripts are used to direct expression, in selected cell types, of
c.g. therapeutic genes (also ribozymes or antisense sequences)
particularly an antigen-encoding sequence for use in gene or cell-based
vaccines; for diagnosing breast cancer and for raising specific
vaccines; for diagnosing breast cancer and for raising specific
antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
and isolate populations of educated, antigen-specific immune effecter
cells, e.g. cytotoxic T lymphocytes, and these used for adoptive

ઠે 요 AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts
that are preferentially transcribed in the metastatic breast tumour
tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942
to AAZ86677 represent tags corresponding to distinct transcripts that are
preferentially transcribed in the primary or non-metastatic breast tumour
tissue (i.e. are downregulated in metastatic breast tumour cells). These
transcripts can be used for diagnosis, prognosis, monitoring and
transcripts can be used for diagnosis, prognosis, monitoring and
transcripts can be used for diagnosis, prognosis, monitoring and
transcripts are used to direct expression of the transcripts are potentially
useful for treatment of (metastatic) breast cancer, while promoters from
the transcripts are used to direct expression, in selected cell types, of
e.g. therapeutic genes (also ribozymes or antisense sequences)
carcines Polypeptides encoded by the transcripts are also useful in
vaccines; for diagnosing breast cancer and for raising specific
antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
adents. Host cells that produce the polypeptides can be used to expand
and isolate populations of educated, antigen-specific immune effecter
cells, e.g. cytotoxic T lymphocytes, and these used for adoptive Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and Human; metastatic breast tumour tissue; breast cancer; tag; primer; non-metastatic breast tumour tissue; gene therapy; anticancer; antimetastatic; vaccine; diagnosis; ss. Metastatic breast tumour cell upregulated transcript tag #341.

that are preferentially transcribed in the metastatic breast tumour that are preferentially transcribed in the metastatic breast tumour cells). AAZ33942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). Presentially transcribed in the primary or non-metastatic breast tumour cells. These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences).

Compounds that mantigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides on be used to expand and isolate populations of educated, antispense used to adoptive cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cells). AAZ883942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These trissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and compounds that modulate expression of the transcripts are potentially compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell.types, of e.g. therapeutic genes (also ribozymes or antisense sequences from the transcripts are used to direct expression, in selected cell.types, of particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter immunotherapy

AAZ80767 to AAZ86971 represent tags corresponding to distinct transcripts that are preferentially transcribed in metastatic breast tumour cells). AAZ86972 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for the primary where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therspeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter

that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ8677 represent tags corresponding to distinct transcribts that are preferentially transcribed in metastatic breast tumour cells). AAZ8677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour citissue (i.e. are downregulated in metastatic breast tumour cells). These transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for diagnosis, prognosis, monitoring and creatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based continually preptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A computational analysis method can be used to identify new biopolymer sequence clusters from sequence sets. The method comprises placing each sequence into a new cluster, and calculating an initial information weight matrix. Other sequences from the set are added to the cluster and the information weight matrix of the cluster is re-computed until the information weight matrix of the cluster is re-computed until the information content of the matrix falls below a threshold. The method is useful for identifying potential DNA-binding sites from a set of oligonuclectide sequences. The method and system may also be used to analyse different types of sequences, eg. the sequences of anho acid subunits in protein polymers may be analysed to identify common or conserved amino acid subunit sub-sequences within the polymers that present sequence represents a synthetic oligonuclectide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Computational method and system for identifying clusters of sequences within a set of sequences, useful for identifying, e.g. DNA-binding
                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a group of genes consisting of 100 genes which are highly expressed in human dendritic cells; a group of genes which are expressed at a higher frequency in human dendritic cells than in human monocytes; and a group of genes which are expressed at lower frequency in human dendritic cells than in human monocytes. Each group of genes are characterised in that cDNAs of these genes respectively have the base sequences of SEQ ID NO:10 to 100 (AAC74014 to AAC74014) and SEQ ID NO:201 to 300 (AAC74013), cach is continuous with the base sequence 5'-CATG-3' to AAC74213), each is continuous with the base sequence 5'-CATG-3' the investigation of the poly-A region. The sequence can be used for the investigation of the immune system and for the study and diagnosis of diseases in which dendritic cells play a significant role, e.g. cancers
                                                                                                                                                                                                                                                                                                                                                                       Groups of genes expressed in human dendritic cells at a greater or lesser extent than in monocytes for investigation and diagnosis of autoimmune disease and tumors.
                                                                                                                                         Human monocyte and dendritic cell expressed gene oligonucleotide #277.

tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hypertensian arteriosclerosis, hyperteins (AAYS0631-633) and the proteins (AAY67598-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90634-36 represent PCR primers related to the human adipose tissue genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A physiologically active protein specifically derived from mammal tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to identification of genes and proteins of adipose

The present invention describes 100 human genes, which are expressed most frequently in human monocytes. The CDNA of each gene has a sequence fully defined in the specification, and lacking the CAYG sequence located adjacent to polyA region. Also described are: (1) an antibody captured from the protein encoded by any of the genes; (2) oligonucleotides obtained from the CDNA sequences; (3) 380 human genes which are expressed most frequently in human macrophages, differentiated from human monocytes by granulocyte-macrophage colony-stimulating factor, the CDNA of each gene has a fully defined sequence, given in the specification, lacking the base sequence CAYG located most closely to the CDNA A region; (4) an antibody specifically for the protein encoded by any of the genes of (3); and (5) oligonucleotides obtained from the CDNA sequences of (3). The genes and CDNAs, are used for the study of gene specificity and disease onset mechanism e.g. oncogenesis, genetic diseases, drug development and diagnosis. AAASSIO7 to AAASSES represent specifically claimed oligonucleotide tag sequences for human genes
               Genes most frequently expressed in human monocytes and GM-macrophages and M-macrophages studied and with cDNAs characterized, for study of gene specificity, disease onset mechanism, drug development and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; adenosine Al receptor; antisense oligonucleotide; hypoxia; adenosine Asa receptor; adenosine Asa receptor; adenosine Asa receptor; phosphorothicate; cardiopulmonary failure; renal failure; ischaemia; endotoxin release; ARDS; acute respiratory distress syndrome; cytoprotective; anti-allergic; anti-inflammatory; anti-hypoxic; subraventricular tachycardia; allergic religiammatory; anti-hypoxic; chronic obstructive pulmonary disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits

C adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

(I) is an adenosine A2a receptor agonist (Ia), or an oligonucleotide

(Ib), containing less than 15% adenosine (A), that is antisense to target

CC (Bb), containing less than 15% adenosine (A), that is antisense to target

CC (Bb), containing less than 15% adenosine (A), that is antisense to target

CC das A1, A2b or A3 agonist activity or A2a antagonist activity or at

CC least no agonist activity or A2a antagonist activity (or at

CC and (1b), and optionally also contains one or more surfactants. The

CC compositions are used to prevent, alleviate and/or treat adenosine

CC compositions are used to prevent, alleviate and/or receptor-mediated cardiac, lung and/or renal damage or failure

CC (particularly where associated with ischemia, toxin release and/or

CC (apitionary disease) and and admansation of supraventricular tachycardia); (adult) respiratory distress syndrome

CC (e.g. associated with sepsis); allegic rhinitis, chronic obstructive

CC sulmonary disease; cardiopulmonary hypoxia associated with administration

CC stress-test agents, particularly where such conditions are associated

with acute inflammation. AAA02712, AAA02772 and AAA03723 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             at least one agent (1) that prevents, alleviates and/or inhibits adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

(1) is an adenosine Aza receptor agonist (1a), or an oligonucleotide ends or an edenosine Aza receptor agonist (1a), or an oligonucleotide ends or segments less than 15% adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine Al, Aza, Azb or Az receptors, and has Al, Azb or Az agonist activity or Aza antagonist activity (or at least no agonist activity or Aza antagonist activity (or all and (1b), and optionally also contains one or more surfaceants. The compositions are used to prevent, alleviate and/or treat adenosine receptor-mediated cardiac, lung and/or renal damage or failure farming and/or renal damage or failure administration of farming and/or renal damage or failure administration of a contraction of a c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  administration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstructive pulmonary disease; cardiopulmoary hypoxis associated with administration of stress-test agents, particularly where such conditions are associated with acute inflammation. AAA02717, AAA02719, AAA02721 and AAA02723 to AAA03715 represent specifically claimed phosphorothioate antisense oligonucleotides for use in the composition of the present invention. AAA02718, AAA02720, AAA02712 and AAA03716 to AAA03720 represent other phosphorothioate oligonucleotides used in the exemplification of the
                                                                                                                                                                                                                             The present invention describes a pharmaceutical composition, comprising

The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

(I) is an adenosine A2a receptor agonist (Ia), or an oligonucleotide (Ib), containing less than 154 adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (i.e. 5 or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2a, A2b or A3 receptors, and chas A1, A2b or A3 agonist activity or A2a antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (Ia) and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine compositions are used to prevent, alleviate and/or release and/or cadministration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis, chronic obstructive pulmonary disease; cardiopulmonary hypoxia associated with administration of stress-test agents, particularly where such conditions are associated with acute inflammation. AAA02717, AAA02719, AAA02721 and AAA02723 to AAA03715 represent specifically claimed phosphorothioate antisense colsponed conditions are associated and phosphorothioate antisense colsponed conditions and phosphorothioate antisense colsponed conditions are associated and phosphorothioate antisense colsponed conditions are associated and phosphorothioate antisense colsponed conditions and phosphorothioate antisense colsponed conditions are associated and phosphoromy phosphoromy phosphoromy phosphoromy phosphoromy phosphoromy phosphoromy phosphoromy phosphor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present invention describes a pharmaceutical composition, comprising

The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

(I) is an adenosine A2a receptor agonist (Ia), or an oligomoclectide can demosine A2a receptor agonist (Ia), that is antisense to target genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2a, A2b or A3 receptors, and has A1, A2b or A3 agonist activity or A2a antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (Ia) and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine (particularly where associated with ischaemia, toxin release and/or administration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstruction of stress-test agents, particularly where such conditions are associated with administration of stress-test agents, particularly where such conditions are associated with actual minimum anticond associated with administration of stress-test agents, particularly where such conditions are associated with actual minimum anticond events inflammation. AAAO2719, AAAO2719, and AAAO2721 and AAAO2721 and AAAO2721 to anticond antico

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (C oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory bronchodilator, antibilatory analgesic, immunosuppressive, antiasthmatic, bronchodilator, antibilatory analgesic, the antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and maliganacies, such as stimulating and certors and transmitters, transcription factors, immunoglobuline and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and creceptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide creeptors, binding proteins and malignancy associated proteins. The creeptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction) and/or bronchoconstriction) and/or lung inflammation, allergy (ies) and/or succeptors, brain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary condition, pulmonary vasoconstriction, inflammation, rejection, pulmonary disease or condition, emphysema, chronic obstructive pulmonary disease syndrome (C Fragments and antisense oligonucleotides used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers

Low adenosine (A) content antisense oligonuclectides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.

Claim 14; Page 120; 1592pp; English.

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with cartivating peptide factors and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, committers, adhosion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, branding proteins, adenosine receptors, branding proteins, adenosine receptors, branding proteins, adenosine receptors, branding proteins and maliagnancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders antisense oligonucleotides may be used in this way to treat disorders including proteins and maliagnancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders and condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociation, allargic syndrome (RDS), pain, cyptic fibrosis (CP), allergic rhinitis (AR), pulmonary informic obstructive pulmonary disease (RDS), pain, cyptic fibrosis (CP), allergic rhinitis (AR), pulmonary informic obstructive pulmonary informic paration and malaration and malarati pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of the present invention

including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes low adenosine (A) content antisense oligonuclectides and compositions (I) comprising them. In the antisense oligonuclectides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antinflammatory, analgesic, immunosuppressive, antiathmatic, hypotensive and cytostatic activities. The antisense oligonuclectides and (I) can be used to down-regulate the

lungivespizatory disorders and malgarancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulina and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, immunoglobulina and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, bracklyinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system receptors, CNS and peripheral nervous and non-nervous system receptors, chemokines, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction) and/or lung inflammation, allergy (ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CP), allergic rhinitis (AR), pulmonary cancer. AAPR18434 to AAPR2154) represent human polynucleotide and/or engents and antisense oligonucleotides used in the exemplification of

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (C) is an above respiratory, bronchodilator, antiniflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with carporatory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and cereptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide (ransmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, cystic fibrosis (CR), allergia (CR), pain, cystic fibrosis (CR), allergia (AR) and malignancy associated with a disease or allergiae, asthmatine, septime, allergy in the malignancy or allergy in pulmonary vasoconstriction, inflammation, cystic fibrosis (CR), pain, cystic fibrosis (CR), allergia (AR) and parietic fibrosis (CR), allergia (AR) and parietic fibrosis (CR) and allergian an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TANGO, 128; 140; 197; 212; 213; 224; 239; modulating agent; asthma; graft versue-host diseases; rheumatoid arthritis; psoriasis; inflammatory bowel disease; septic shock; ulcerative colitis; Crohn's disease; chronic myelogenous leukemia; cancer; liver disease; autoimmune disease; casteoarthritis; Lyme's disease; cachexia; autoimmune disease; myasthemia gravis; autoimmune diabetes; systemic lupus erythematosus; transgenic animal; diagnosis; prognosis;

                                                                                                                                                                                                                                   Nucleic acids encoding TANGO polypeptides are useful as modulating agents for regulating cellular processes like asthma, graft versus-host diseases, rheumatoid arthritis, poriasis; inflammatory bowel disease, septic shock, ulcerative colitis, Crohn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodgkin's disease, osteoarthritis, Lyme's disease, cachexia and autoimmune diseases e.g. myasthemia gravis, autoimmune diabetes and systemic lupus erythematosus. The nucleic acids polypeptides themselves. Partial TANGO-128, 140, 197, 212, 213, 224, 239 sequences are useful in forensic biology, for diagnostic assays, prognostic assays, pharmacogenomics and for monitoring clinical trials. TANGO-129, pypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a disorder assays, associated with aberrant TANGO expression. A wide range of cellular

                                                                                                The invention relates to a set of novel primers and probes. The genes cloned are used in affinity purification of genes, and for cloning associated biosynthetic pathway genes. The gene probes/primers may be used in the discovery and characterization of bioactive compound coding sequences and gene clusters, as well as in the discovery of either single genes or entire clusters of adjacent genes involved in the total synthesis of compounds of interest, e.g. secondary metabolite biosynthetic pathways the products of which comprise very useful libraries for antibiotic and other therapeutic compound screening. The cloned genes are further useful for hybridization screening. The sequence represents a universal high frequency bacterial CDS decamer PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a set of novel primers and probes. The genes cloned are used in affinity purification of genes, and for cloning associated biosynthetic pathway genes. The gene probes/primers may be used in the discovery and characterization of bioactive compound coding sequences and gene clusters, as well as in the discovery of either single genes or entire clusters of adjacent genes involved in the total synthesis of compounds of interest, e.g. secondary metabolite biosynthetic pathways the products of which comprise very useful libraries for antibiotic and other therapeutic compound screening. The
  genes and gene clusters for affinity purification of genes or in cloning associated biosynthetic pathway genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New primers and probes useful for targeted cloning and enrichment of genes and gene clusters for affinity purification of genes or in cloning associated biosynthetic pathway genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primer; probe; affinity purification; cloning; biosynthetic pathway; hybridization screening; restriction endonuclease; universal; PCR; ss

The present sequence is that of an Egr-1 binding site that has the capability of conferring Egr-1 dependency upon a promocer. An Egr-1 binding site in found within the promoter (see AAF90451) of the human Egr-1 gene, and may be involved in autoregulation. Transcription factor Egr-1 is a potential regulator of over 30 genes and plays a role in growth, execular endothelium. The Egr-1 promoter, its variants, or any other consounder that is regulatable by Egr-1, can be used in an expression. Such compounds are used as medicaments or in drug development programs, particularly in the identification of drugs for wound healing (claimed). Conditions that may be treated include dermal ulcers arising from conditions that may be treated include dermal ulcers arising from conditions also be associated with e.g. cataracts, skin graft procedures, burns, psoriasis, and tissue engineering. Identified compounds may also be useful to reduce scarring during wound healing, restenosis following percutaneous trans-luminal coronary angioplasty, to modulate vessel wall calcification, treat cancer or other cell
cloned genes are further useful for hybridization screening. The sequence represents a universal high frequency bacterial CDS decamer PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Screening modulators of epidermal growth factor receptor-1 useful for wound healing, involves providing expression system that is regulated by Egr-1 and analyzing effect of compound on expression from system.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Promoter; Egr-1; transcription factor; human; vulnerary; wound healing; dermatological; antiulcer; ds.

                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH613161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                                                                                                                                                      transcriptome, gene expression pattern, cancer, drug screening; diagnosis, cell specific gene expression, ss.

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitouely expressed in humans. They can also be used to screen for drugs, reduce cancer specific agene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   isolated polynucleotides, useful for identifying specific cell type,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; transcriptome; gene expression pattern; cancer; drug screening; cancer diagnosis; cell specific gene expression; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         d
                                                                                                                                                                                                                                                                             ö
                                                                                       The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           isolated polynucleotides, useful for identifying specific cell type,

                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                            The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; haplotyping; glycoprotein Ib (platelet) alpha protein; GPIBA;

The invention relates to methods for haplotyping glycoprotein Ib (platelet) alpha polypeptide (GPIBA) gene of an individual. The method involves determining if the individual has one of the GPIBA haplotypes or haplotype pairs. The methods of the invention are useful for disease diagnosis and in the discovery and development of drugs for treating diseases associated with GPIBA activity e.g. Bernard-Soulier syndrome, platelet type von Willebrand disease, HIV and Alzheimer's disease. The present sequence is a primer used for detecting human GPIBA gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an lipopolysaccharide (LPS) activated human monocyte expression gene group consisting of the high-ranking 50 genes of the highest expression among the genes expressed by human monocyte stimulated by LPS in which the CDNA of each gene has the base sequence of (AAH32628 to AAH32677) continuous to the base sequence 5. CATG-3' nearest to the polyA region. The gene group is useful for the development of new means for the diagnosis and the treatment of various human diseases in which human monocyte plays an important role. AAH32628 to AAH32943 represent specifically claimed LPS activated human monocyte expression gene CDNA tags from the present invention. AAH32944 represents

an LPS activated human monocyte expression gene cDNA sequence encoding AAB98009, which are given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes an lipopolysaccharide (LPS) activated human monocyte expression gene group consisting of the high-ranking 50 genes of the highest expression among the genes expressed by human monocyte stimulated by LPS in which the cDNA of each gene has the base sequence of (AAH32628 to AAH32677) continuous to the base sequence 5'-CATG-3' nearest to the polyA region. The gene group is useful for the development of new means for the diagnosis and the treatment of various human diseases in which human monocyte plays an important role. AAH32628 to AAH32943 represent specifically claimed LPS activated human monocyte expression gene CDNA tags from the present invention. AAH32944 represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        an LPS activated human monocyte expression gene cDNA sequence encoding AAB98009, which are given in the exemplification of the present invention
                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; LPS; lipopolysaccharide; monocyte expression gene; tag; EST; expressed sequence tag; diagnosis; human disease; treatment; ss.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate cantitungal drugs comprising: (a) contacting a test substance which sets substance which a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of identifying human genes which are involved in cell cycle progression contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell with a candidate drug and contitoring expression in the yeast cell with a candidate drug and contitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle, the differentially cexpression is affected by the class of the cell cycle, the differentially cexpression is affected by the class of the cell cycle, the differentially cycle sused to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. The NORF genes in the exemplification of the present invention cycle and for identify and the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate artifungal drugs comprising expression of a NORF gene whose expression of cell; and (b) monitoring expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (b) must gene whose expression varies as in M3; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a cyeast cell comprising contexting a yeast cell with a candidate drug and contexting a characteristic effect on gene expression in a cyeast cell of at least 1 NORF genes may be used as markers of phases of the cell cycle. The expressed genes may be used as markers of phases of the cell cycle, the differentially cycle and for identification of antifungal drugs. April 2056 to AAF44064 represent SAGE tags used in the expression in the expression of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                         Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; ds.

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle. Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotated ORF; SAGB; serial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; ds. Yeast NORF gene SAGE tag oligonucleotide SEQ ID NO:1475. Kinzler K; AAF34736 standard; DNA; 10 BP 14-JUN-2000; 2000WO-US016223. 99US-00335032. Velculescu V, Vogelstein B, (UYJO ) UNIV JOHNS HOPKINS. (first entry) Saccharomyces cerevisiae. WPI; 2001-061874/07. WO200077214-A2. 23-MAR-2001 16-JUN-1999; 21-DEC-2000. AAF34736; **AAF3473**6 

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame; or nonamotated ORF) genes comprising a SAGB (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log to antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of varies as in M1, where a test substance which modifies the expression of cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression in a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a contiduct of a contiguous nucleotides of a NORF gene whose expression is affected by the class of the cell cycle, the differentially cexpression is affected by the class of the cell cycle, the differentially cexpression is affected by the class of the cell cycle, the differentially cexpressed genes may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. The NORF gene may be used to identification of the present invention.

Ceptersed to AAF33267 represent linkers and PCR primers used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for comprising contacting human DNA with a probe which comprises at least 10 comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression in a class of drugs having a characteristic effect on gene expression in a contiguous nucleotides of a NORF gene whose expression is affected by the class of drugs. The NORF gene may be used construint or and affect phases of the cell cycle, the differentially expression is affected by the class of drugs. The NORF gene may be used to identification of antienge which affect the cell cycle, the differentially cycles and for identification of the present invention. AAF31362 to AAF31367 represent linkers and hor in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previounly assigned open reading frame; nonamnotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; ds.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonaminotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at ceat 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate cell; and (b) monitoring expression of a NORF gene whose expression of cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at lm M; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a contiguation in the yeast cell with a candidate drug and contacting expression in the yeast cell with a candidate drug and conting expression in the yeast cell of at least 1 NORF genes may be used to structuring expression in the yeast cell of at least 1 Cycle, the differentially expression is affected by the class of the cell cycle, the differentially contacting expression in the yeast cell of at least 1 Cycle, the differentially expressed genes may be used as markers of phases of the cell cycle and for identification of antifungal drugs, TAR13262 to AAR44064

Cycle and for identification of antifungal drugs, the differentially cycle expressed to identification of antifungal drugs.

Cycle and for identification of antifungal drugs which affect the cell cycle and for identification of antifungal drugs.

Cycle and for identification of antifungal drugs which affect the exemplification of the present invention. ö Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle. Gaps Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotated ORF; SAGE; sactial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; ds. ö Indels Yeast NORF gene SAGE tag oligonucleotide SEQ ID NO:1948. ö 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame, or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of the modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying a candidate drug as a member of a comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORP gene whose expression varies as in M1; contiguous nucleotides of a NORP gene whose expression in a contiguous nucleotides of a NORP gene whose expression in a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle, the differentially cycle and for identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs, which affect the cell cycle and for identify candidate drugs, which affect the cell cycle and for identify candidate drugs. The NORF genes may be used to identify candidate drugs, which affect the cell cycle and for identify candidate drugs.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamocated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a
                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The
AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 61
```

```
The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human blnA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1, and (A) a method (M4) for identifying a candidate drug as a member of a clars of drugs having a characteristic effect on gene expression in a class of drugs having a characteristic effect on gene expression in a characteristic effect on gene expression in a characteristic cell of at least 1 NORF gene whose
                                                                                                                                                                                                             ö
methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Yeast gene coding sequences comprising NORP genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Yeast, Saccharomyces cerevisiae, characterisation, cell cycle, NORF, nor previously assigned open reading frame, nonannotated ORF, SAGE, serial analysis of gene expression, antifungal, tag, identification,

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned oppen reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G3/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous mucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a
                                                                                                                                                                                                                                                                         ö
expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                       Gaps

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 40; 419pp; English

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast earl; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression

comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a pyeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44664 represent Linkers and PCR primers used in the SAGE method, in the exemplification of the present invention.

Novel genetic variants of even-skipped homeo box 1, EVX1 gene useful for therapeutic purposes and for expressing EVX1 protein useful in identifying drugs to treat neurological diseases.

Claim 18; Page 13; 69pp; English.

nucleotide sequence which is a polymorphic variant of a reference agequence for the even-skipped homeo box I (homologue of Drosophila) (EVX1) gene or its fragment, or a polymorphic variant of a reference sequence for a EVX1 cDNA or its fragment. EVX1 polypeptide (II) is useful The invention relates to an isolated polynucleotide (I), comprising a

CC for screening for drugs targeting the polypeptide, by contacting the EVX1 polymorphic variant with a candidate agent and assaying for binding a activity. A method is described for identifying an association between a trait such as a clinical response to a drug targeting EVX1 and a clinical response to a drug targeting EVX1 and a complexity. The methods are useful in developing diagnostic tests and therapeutic treatments for neurological diseases. (1) is useful for studying the expression and function of EVX1 and expressing EVX1 protein for use in screening for candidate drugs to treat diseases related to EVX1 activity. The polymorphism and haplotype care diseases related to EVX1 activity. The polymorphism and haplotype data are useful for validating whether EVX1 is a useful for reducing bias in clinical trials of such drugs. (1) is useful for reducing bias in clinical trials of such drugs. (1) is useful for the haplotype pairs. Establishing the EVX1 haplotype pair of an individual is useful for such papertype or haplotype pair of an individual is useful for studying efficiency and reliability of several steps in the discovery and efficiency and reliability of several steps in the discovery and cefficiency and reliability of several steps in the discovery and cefficiency of the EVX1 as a candidate target for treating diseases associated with EVX1 activity. (1) is useful for studying expression of the EVX1 isogenes in vivo, for in vivo screening and teating the EVX1 protein and for testing the efficacy of therapeutic agents and compounds for neurological diseases in a condigate target for treating a specific condition or disease therapeutic and prognostic formats and therapeutic methods, for immunoprecipitating and prognostic formats and therapeutic methods, for immunoprecipitating cand prognostic formats and therapeutic etchniques. The present invention describes an isolated human period (Drosophila)

boundlogue 1, (PER1) polynucleotide (1) comprising a sequence which is a

conjunctive variant for a reference sequence (ABL52077) for the PER1 gene

or its fragment, or a polymorphic variant of a reference sequence

(ABL52078) for a PER1 CDNA or its fragment. The present invention also

describes methods for genotyping and haplotyping the PER1 gene of an

individual. (1) is useful in studying the expression and function of

PER1, and in expressing PER1 protein for use in screening for candidate

crugs to treat diseases related to PER1 activity. (1) is useful for

therapeutic purposes. A recombinant non-human organism transformed or

transfected with (1) can be used for studying expression of the PER1

isogenes in vivo, for in vivo screening and testing of drugs targeted

against PER1 protein, and for testing the efficacy of therapeutic agents

and compounds for discorders associated with circadian rhythm regulation.

The present sequence represents a preferred oligonucleotide primer for

human PER1, which is used in the exemplification of the present invention ö Novel isolated human period Drosophila homolog 1 polynucleotide, useful for therapeutic purposes, for studying the expression and function of the polynucleotide, and for expressing the homolog. Novel genetic variants of Solute Carrier Family 1 (Glutamate/Neutral Amino Acid Transporter), Member 4 isogenes, for improving efficiency and reliability in drug development for treating cancers. glutamate/neutral amino acid transporter; neurological disease; PCR; ss; amino acid transporter disorder; single nucleotide polymorphism; SNP. The invention relates to an isolated polynucleotide (I) comprising a first nucleotide sequence which comprises solute carrier family 1 (glutamate/neutral amino acid transporter), member 4 (SLC1A4) isogenes Solute Carrier Family 1 (SLC1A4) primer extension oligonucleotide #24. Novel genetic variants of Lipase, Hormone-Sensitive isogenes, useful for improving efficiency and reliability in drug development for treating diseases associated with LIPE activity, e.g. obesity and male sterility.

Claim 17; Page 16; 142pp; English.

The present invention relates to a new polynucleotide comprising a nucleotide sequence which comprises lipase, hormone sensitive (LIPE) isogenes. The invention is useful in screening for drugs targeting LIPE isogenes that are useful for treating obesity and male sterility. The

```
methods of the invention are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for reliability of several steps in the discovery and development of drugs for treating diseases associated with LIPE activity. The polymiclectide is useful in studying the expression and function of LIPE, and in expressing LIPE protein for use in screening for candidate drugs to treat diseases related to LIPE activity. It is also useful in studying the effect of the variation on the biological activity of LIPE as well as on the binding affinity of candidate drugs targeting LIPE for the treatment of obseity and male sterility. The invention is useful for studying the expression of LIPE isogenes in vivo, for in vivo screening and testing of the capeutic agents and compounds for treating obseity and male sterility in a biological system. The present nucleic acid sequence respresents one of a collection (ABXSGO26-ABXSGO31) of oligonucleotide primers that were used in the invention to detect polymorphisms in the human LIPE gene

New polymorphic variants comprising acetylcholinesterase (ACHE) isogene, useful in expressing ACHE protein for use in screening for candidate drugs to treat diseases related to ACHE activity, e.g. neurological diseases or cancer.

Claim 18; Page 14; 79pp; English.

The invention relates to a polynucleotide comprising a polymorphic variant of an acetylcholinesterase (ACHE) gene or fragment, protein or complement, the variant comprising an ACHE isogene defined by a haplotype selected from haplotypes 1-20 listed in the specification. Also included are methods for haplotyping and genotyping the ACHE gene of an individual, a method for predicting a haplotype pair for the ACHE gene of an individual, a method for identifying an association between a trait

and at least one haplotype or haplotype pair of ACHE gene, recombinant nonhuman organisms transformed or transfected with the polynucleotide where the organisms expresses ACHE protein encoded by the first nucleotide sequence or encoded by the polynorphic variant sequence, an isolated antibody specific for and immunoreactive with ACHE, a method of screening for drawing targeting the polymorphic waith ACHE, a method of screening for drawing activity, a computer with a candidate agent and assaying for binding activity, a computer System for storing and analysing polymorphism data for ACHE gene and a genome anthology for ACHE gene which comprises ACHE isogenes defined by haplotypes 1-20 given in the specification. The Polymorphisms are useful for studying the biological function of ACHE as well as in identifying drugs targeting this protein for the treatment of disorder related to its drugs targeting this protein for the treatment of disorder related to its abnormal expression or function. The polymorphic variants may also be used in screening for compounds targeting ACHE to treat a specific condition or disease predicted to be associated with ACHE activity e. Gencer, leukaemia, and tumours The ACHE gene maps to human chromosome conduction a primer extension experiment to detect the polymorphic conduction of a permitten of the invention \$

Novel genetic variants of V-Fos FBJ Murine Osteosarcoma Viral Oncogene Homolog (FOS) isogenes, useful for improving efficiency and reliability in drug development for treating developmental bone disorders.

Claim 17; Page 14; 73pp; English.

The invention relates to single nucleotide polymorphisms in the gene encoding the human v-fos FBJ murine osteosarcoma viral oncogene homologue (FOS) polypeptide. A method for haplotyping the FOS gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and

determining whether one of the copies of the gene is defined by one of
the FOS haplotypes given in the specification or whether both copies are
defined by a haplotype pair. This method is useful in genotyping, whereby
all possible haplotype pairs can be assigned to specific genotypes. An
association between a trait and a haplotype or haplotype pair of the FOS
gene can be identified by comparing the frequency of the haplotype or
haplotype pair in a population exhibiting the trait with the frequency of
the haplotype or haplotype pair in a reference population, where a higher
haplotype frequency in the trait population indicates the trait is
associated with the haplotype or haplotype pair. FOS and its
corresponding DNA are used for studying the expression and function of
FOS, for use in screening for candidate drugs to treat diseases related
to FOS activity, such as developmental bone disorders and tumours. The
sequences are also useful for studying the effect of variation on the
biological activity of
candidate drugs targeting FOS. Sequences ABK8113F8-ABK81377 represent ö The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) and finc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypeptide (II) comprising (I); (2) a polymotleotide (III) encoding (I) or (II); and (S2) a below the selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus. ```
This invention relates to an isolated polynucleotide which is a polymorphic variant of a reference sequence for sodium channel voltage gated type 2 beta polypeptide (SCN2B) gene. The methods have gated type 2 beta polypeptide (SCN2B) gene. The methods have applicability in developing diagnostic tests and therapeutic treatments for demyelinating diseases. The protein is useful for studying the expression and function of SCN2B and expressing SCN2B protein for use in screening for candidate drugs to treat diseases related to SCN2B activity. The polymorphism and haplotype data are useful for validating whether SCN2B is a suitable target for drugs to treat demyelinating whether SCN2B is a suitable target for drugs to treat demyelinating the haplotyping method is useful to validate SCN2B as a candidate target for treating a specific condition or disease predicted to be associated for treating a struity. A recombinant non-human organism transformed or transfected with the polypeptide is useful for studying expression of the SCN2B isogenes in vivo, for in vivo screening and testing of drugs against SCN2B protein and for testing the efficacy of therapeutic agents
                                                                                                                                                                                                                                                                                                                        ö
useful in studying gene function, and for human therapeutics and plant engineering. (1), (11) or (III) is useful in therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of gene expression. (1) has improved affinity and specificity for their target sequences, as well as enhanced biological activity. AB071213 to ABQ72214 and ABP48191 to ABP51230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotide containing polymorphisms in the human sodium channel voltage gated type 2 beta polypeptide (SCN2B) gene, for developing drugs for treating demyelinating diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; sodium channel voltage gated type 2 beta polypeptide; SCN2B; ds; gene therapy; neuroprotective; demyelinating disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to genetic variants of the homeo box D3 (HOXD3)

gene. HOXD3 gene includes 9 polymorphic sites PS1-PS9. Haplotypes (HTS)

or haplotype pairs (HP) for PS1-PS9 in the HOXD3 gene are useful for
improving the efficiency and reliability of several steps in the
discovery and development of drugs for treating diseases associated with
HOXD3 activity, e.g., developmental disorders and tumours. HOXD3 and in
sypressing HOXD3 protein for use in screening for candidate drugs to
creat diseases related to HOXD3 activity of HOXD3 and in
expressing HOXD3 protein for use in screening for candidate drugs to
treat diseases related to HOXD3 activity of HOXD3 as well as on the
binding affinity of candidate drugs targeting HOXD3 for the treatment of
the variation on the biological activity of HOXD3 as well as on the
binding affinity of candidate drugs targeting HOXD3 for the treatment of
developmental disorders and tumours. An antibody against HOXD3 is useful
methods. A recombinant non-human organism is useful in studying
expression of the HOXD3 isogenes in vivo. Allele-specific
oligonuclectides (ASO) are useful as probes and primers and for assaying
a polymorphism in the target region. The present sequence is a primer
used for detecting human HOXD3 gene polymorphisms
                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New genetic variants of Homeo Box D3 for studying expression and function of the protein, and for screening drugs to treat diseases e.g. developmental disorders and tumors.
and compounds for demyelinating diseases in a biological system. This sequence is used during the detection of polymorphisms of the SCN2B gene
                                                                                                                                                                                                                                                                                                                                        Human; homeo box D3; HOXD3; polymorphism; developmental disorder;

The sequences can be used to haplotype the POR gene of an individual, and to establish whether POR is a suitable target for drugs to treat cancer and disorders associated with impaired protein synthesis in cells. The present sequence is an allele specific primer extension oligonucleotide for the coding sequences of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New genetic variants comprising haplotypes of the P450 (cytochrome) oxidoreductase (POR) isogene, useful in improving the efficiency of drug screening protocols for compounds targeting POR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are expressed in activated human Th1 and/or Th2 Calls. The SAGE tags of this invention consist of a sequence of 10 mucleotides located downstream of the 5'-CATG-3' sequence motify lying nearest to the polya region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes capressed in Th1 and/or Th2 cells, antibodies against these proteins, and inhibitors of the expression of groups of genes that are expressed in either or both the two cell types. Groups of genes expressed in Th1 and/or Th2 cell types may be used for the diagnosis and treatment of Th1 and Th2-related disorders. Sequences ABV78390-ABV78560 are SAGE tags representing 171 genes which are more highly expressed in Th1 cells compared with Th2 cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SAGE tag; serial analysis of gene expression; human; chronic hepatitis C; CH; liver tissue; hepatocellular carcinoma; cancer; tumour; HCC; expression pattern; differential expression; ss.
SAGE tag; serial analysis of gene expression; human; Th1 cell; activated T cell; T lymphocyte; immune response; expression pattern; preferential expression; immune disorder; EST; expressed sequence tag;
                                                                                                                                                                                                                                                                                                                                                         Human activated Th1 and Th2 cell expression gene group, useful for the diagnosis and treatment of Th1 and Th2-related diseases.

The invention relates to SAGE (serial analysis of gene expression) tags
representing groups of genes which are differentially expressed in human
Cdronic hepatitis C (CH) liver tissue or hepatitis C-induced
chronic rectionma (HCC) compared with normal human liver tissue.
The SAGE tags of this invention consist of a sequence of 10 nucleotides
coreated downstream of the 5'-CATG-3' sequence motif lying nearest to the
polya region of cDNAs derived from a variety of genes. These tags serve
co uniquely identify each transcript and can thus be used to analyse the
pattern of gene expression in particular cell types. The invention also
correlates to proteins encoded by the genes expressed in chronic hepatitis C
liver tissue or HCC, antibodies against these proteins, and inhibitors of
the expression of groups of genes that are overexpressed in chronic
hepatitis C liver tissue or HCC. Groups of genes differentially expressed
in chronic hepatitis C tissue or HCC. Groups of genes differentially expression
c treatment of these diseases. Such genes, inhibitors of their expression
c activity, and antibodies against the gene products may be used in the
development of drugg to treat chronic hepatitis C and/or HCC. Sequences
challed and the compared which are overexpressed in chronic
expressed genes out of those genes which are overexpressed
corrections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SAGE tag; serial analysis of gene expression; human; chronic hepatitis C; CH; liver tissue; hepatocellular carcinoma; cancer; tumour; HCC; expression pattern; differential expression; 88.

                                                                                                                                                                                                                                                                                                                                                                                   Š
                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                   representing groups of genes which are differentially expressed in human chronic hepatitis C (CH) liver tissue or hepatitis C-induced chronic hepatitis C (CH) liver tissue or hepatitis C-induced chronic hepatitis C (CH) liver tissue or hepatitis C-induced chronic human liver tissue.

The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the 5'-CATG-3' sequence motif lying nearest to the polya region of CDNs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also conclude to the expression of groups of genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of the expression of groups of genes that are overexpressed in chronic chepatitis C liver tissue or HCC groups of genes differentially expressed in chronic hepatitis C tissue or HCC may be used for the diagnosis and treatment of these diseases. Such genes, inhibitors of their expression conference against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences ABV84391-ABV84490 are SAGE tags representing the 100 most highly hepatically lar carrings of those genes which have a coverexpressed in chronic hepaticis C expressed in carrings of those genes which have a carrings of those development of those dense with have a coverexpressed in the carrings of those genes with a coverexpressed in the carrings of those development of those dense with have a coverexpressed in the carrings of those dense with have the coverexpressed in the carrings of those dense with have the coverexpressed in the carrings of those dense with the coverexpressed in the carrings of those dense with the carrings of the c

```
The invention relates to single nucleotide polymorphisms in the gene encoding the human G protein-coupled receptor similar to the adrenomedullin receptor (ADMR) polypeptide. A method for haplotyping the adrenomedullin receptor (ADMR) polypeptide. A method for haplotyping the more polymorphic sites and determining whether one of the copies of the gene is defined by one of the ADMR haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype or haplotype or haplotype pair of the ADMR gene can be identified by comparing the frequency of the haplotype or haplotype or haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype with the trait with the frequency of the haplotype or haplotype or haplotype or haplotype pair in a reference population, where a higher haplotype or the haplotype or haplotype pair. ADMR and its corresponding DNA are used
                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, G protein-coupled receptor similar to the adrenomedullin receptor; AbMR; haplotyping; haplotype pair; congestive heart failure; primer; ss; arterial hypertension; pulmonary hypertension; renal failure; sepsis; chromosome 12; single nucleotide polymorphism; PCR.
              capable of supporting a neoplastic character of cancer such as growth, invasion or spread. These myc target or tag sequences are identified by SAGE (serial analysis of gene expression). The library is useful to find new diagnoses and treatments for cancer. The invention is also useful to enhance production of recombinant proteins in a production system with high expression of endogenous or transfected myc oncogenes. ABK23412-ABK23828 represent transcript tag DNA sequences that are activated or repressed by N-myc in human neuroblastoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel G-protein coupled receptor similar to the adrenomedullin receptor gene, useful therapeutically and in screening for drugs targeting

The invention relates to an isolated human superoxide dismutase 1, soluble (amyotrophic lateral sclerosis 1 (adult)) (SOD1) polynucleotide (1) comprising a sequence which is a polymorphic variant of a reference sequence for the SOD1 gene of an individual, involves: (a) determining whether the individual has one of the SOD1 involves: (a) determining whether the individual has one of the SOD1 cone copy of the SOD1 gene present in the individual, the determining for one copy of the SOD1 gene present in the individual, the identity of the nucleotide at two or more polymorphic sites selected from PSI-7. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the specification. The method is also useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases in the discovery and development of drugs for treating a specific condition or disease associated with SOD1 activity. It can further be used in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with SOD1 activity. (1) is useful in studying the expression and function of SOD1, and in creat expressing SOD1 protein for use in screening for candidate drugs to treat
                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   18
for studying the expression and function of ADMR, for use in screening for candidate drugs to treat diseases related to ADMR activity, such as congestive heart failure, arterial hypertension, pulmonary hypertension, renal failure, and sepsis. Sequences ABKR01304-ABKR01325 represent allelespecific oligonucleotide PCR primers used to detect ADMR gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sclerosis 1 (adult);
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated human superoxide dismutase 1 (SOD1) soluble polynucleotide, useful for screening therapeutic compounds, comprises a sequence which a polymorphic variant of reference sequence for the SOD1 gene or its

diseases related to SOD1 activity. AAS95660-AAS95710 represent human superoxide dismutase 1, soluble (amyotrophic lateral sclerosis 1 (adult)) (SOD1) allele-specific oligonucleotides and related PCR primers as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a polypeptide (I) which is a polymorphic variant (PV) of the acetyl-Coenzyme A acyltransferase (peroxisomal 3-oxocyl-Coenzyme A thiolase) ACAH protein (ABBOSIS)6. ACAH is located on chromosome 3p23-p22. (I) can be encoded by ABA91286 (or ABA93288) where the sequence comprises one of the haplotypes shown in Table 4 or one of the haplotype pairs shown in Table 3, where Tables 3 and 4 are given in the specification. The polynucleotide encoding ACAAI can be used for providing haplotype and spenotype information of an individual. Furthermore, the polynucleotide is useful for the treatment of disorders related to its abnormal expression or function. ABA93289 to ABA93383 represent allele specific oligonucleotides (ACOS) which are used in the detection of polymorphisms in the human ACAAI gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated polynucleotide, comprising a polymorphic variant of the acetyl-conzyme A acyltransferase 1 (peroxisomal 3-oxoacyl-Coenzyme A thiolase) gene useful for providing haplotype information and in therapy for treating related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; acetyl-Coenzyme A acyltransferase; ACAA1; chromosome 3p23-p22; peroxisomal 3-oxoacyme A thiolase; SNP; genotype; haplotype; single nucleotide polymorphism; polymorphic variant; enzyme; probe; primer; allele specific oligonucleotide; se.
                                                                                                                                                                       Gaps
